Created this website using pure python

Membership From/Anvil Editor:-

Website link:- https://smart-ragged-crayfish.anvil.app

Form1:-

Code:-

```
from ._anvil_designer import Form1Template
import anvil.server
import anvil.tables as tables
import anvil.tables.query as q
from anvil.tables import app_tables
from anvil import Notification

class Form1(Form1Template):
  def __init__(self, **properties):
    # Set Form properties and Data Bindings.
    self.init_components(**properties)

    # Any code you write here will run before the form opens.

  def outlined_button_1_click(self, **event_args):
    """This method is called when refreshing_data_bindings is called"""
    name = self.text_box_1.text
    weight = int(self.text_box_2.text)
    address = self.text_area_1.text
    personal = self.check_box_1.checked
```

```
anvil.server.call('submit',name=name, address=address, personal=personal, weight=weight)
Notification("Your respones has been recorded").show()
```

Servermodule1:-

Code:-

```
import anvil.email
import anvil.tables as tables
import anvil.tables.query as q
from anvil.tables import app_tables
import anvil.server

# This is a server module. It runs on the Anvil server,
# rather than in the user's browser.
#
# To allow anvil.server.call() to call functions here, we mark
# them with @anvil.server.callable.
# Here is an example - you can replace it with your own:
#
# @anvil.server.callable
# def say_hello(name):
#   print("Hello, " + name + "!")
#   return 42
#

@anvil.server.callable
def submit(name, weight, address, personal):
app_tables.gym.add_row(name=name, address=address, personal=personal, weight=weight)
```

```
anvil.email.send(to="abirsaha12345678@gmail.com", subject="Response from anvil app",
                 text=f"Feedback from{name}: weight is {weight} and they live at: {address}. personal Training requird: {personal}”)
```
